

# PRODUCT CATALOGUE

[www.ksk-pm.cz](http://www.ksk-pm.cz)

We have been manufacturing ball screws since 1967 and we deliver them almost all over the world. To provide our customers with the highest quality of the products and co-operation, we keep investing a lot of effort in continuous improvement. Thanks to this effort, every year we fight for the top positions in the leading innovative competitions. A certificate of quality in compliance with EN ISO 9001:2008 proves that our quality management system is at a high level. We also aim for maximum support of the industrial machinery

development activities in our area, for which we participate in the following associations:

Association of  
Engineering  
Technology

CECIMO

Brno Regional Chamber  
of Commerce

## OUR CUSTOMERS APPRECIATE ESPECIALLY THE FOLLOWING CHARACTERISTICS:

### Quality

- We use new state-of-the-art technologies for manufacture and testing.
- Every ball screw undergoes substantial in-process and output inspections.
- We archive measured values for every product.

### Speed of delivery

- Our usual lead times are within six weeks from order placement.
- In exceptional cases we are able to manufacture and deliver in five days from order placement

### Reliability

- We always meet the agreed delivery deadlines.
- In case of customer doubt we immediately address the situation on the spot.

### Development and courage

- We are not afraid of designing and implementing solutions for untypical applications.
- We take up full responsibility for our solutions.
- Thanks to our in-house development department we are very quick and flexible in this designing.

### Customer orientation

- We produce on the basis of client drawings.
- We are able to produce matrices with smaller stop dimensions than required by ISO 3408.
- We like to actively engage in the proposed movement axes of our customers, helping them in correct dimensioning and cost-saving solutions.

### Service

- We repair older ball and trapezoidal screws.
- In the case of an irreparable defect we are able to return the defective ball screw in short-term operation with an offer of a replacement made according to the original screw.

# GENERAL INFORMATION ON BALL SCREWS, FAQS

## 2.1 Application and use

**Ball screws** (hereinafter BS) are structural elements, which transmit the rotary movement to straight movement with high efficiency (these screws are not self-locking). They feature high rigidity, accuracy and durability.

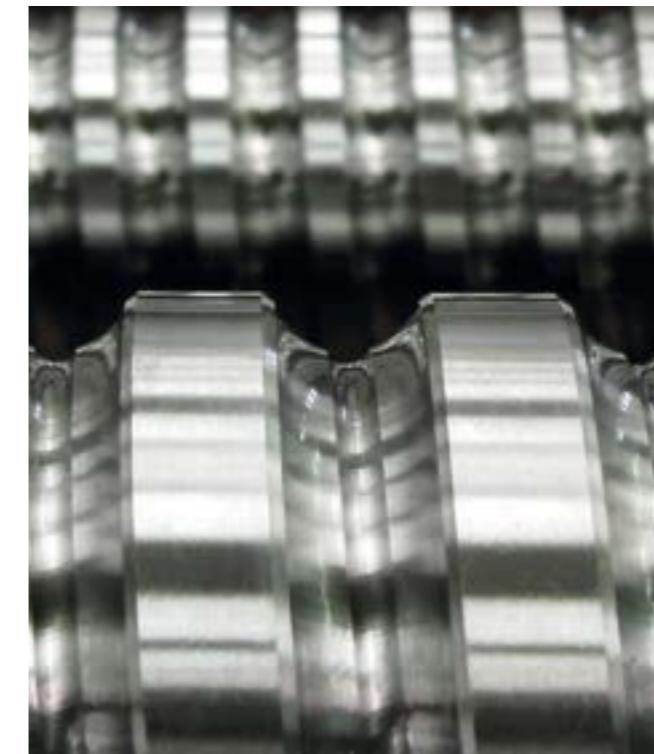

The ball screws are used in various machinery sectors, especially due to their high efficiency ensured by a low rolling resistance. BSs are most often used in the following sectors:

Application industry	Application example	Precision grade					
		P0	P1	P3	P5	T5	T7
Machine tools industry	Horizontal boring machines		●	●	●		
	Lathes			●	●		
	Grinding machines	●	●				
	Milling machines		●	●	●		
	Machining centres		●	●	●		
	Drilling machines			●	●		
	Wire cutting machines		●	●			
	Laser cutting machines			●	●		
	Electric presses			●	●		
	Bending machines			●			
	Broaching machines		●	●			
	Woodworking machines				●	●	
Plastic industry	Plastic injection molding machines			●	●		
Automotive industry	Steering systems		●	●			
	Car jacks					●	●
Semiconductor industry	PCB drilling machines		●	●			
	Lithographic machines	●	●				
Aircraft industry	Wing spoiler actuators		●	●			
	Lifting systems					●	●
	Braking systems			●	●		
Industrial robots	Cartesian, articulate or SCARA types	●	●	●			
Metallurgical Industry	Forming lines			●	●		
Nuclear industry	Fuel rod control systems	●	●				
	Refuelling systems	●	●				
Metrology	Three dimensional measuring machines	●	●				
	Microscopes	●	●				
Entertainment industry	Lifting systems of stages in theatres			●	●	●	
	Amusement attractions				●	●	
Medical industry	X-RAY and other medical machines		●	●			
	Hospital beds				●	●	

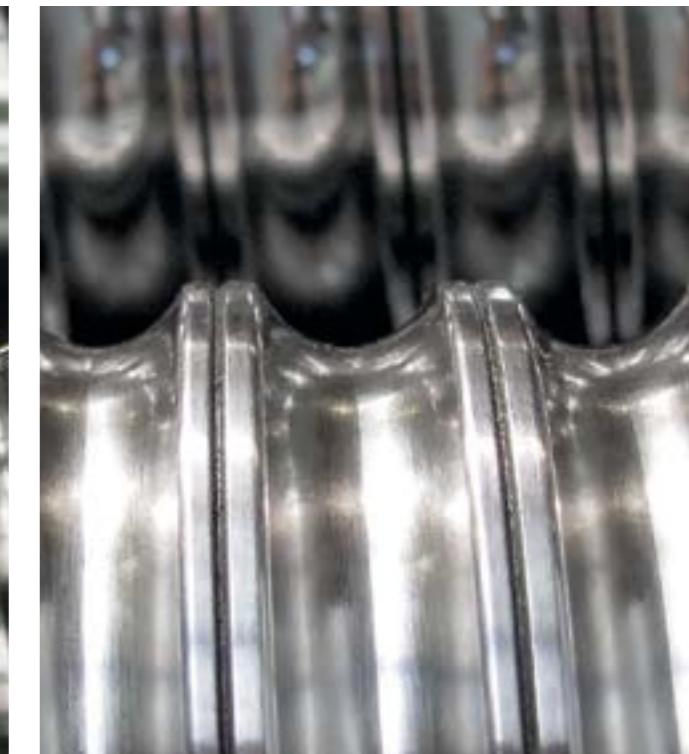

## 2.2 Standard manufacturing technology for making the ball screw thread

Accuracy and quality of the ball screws are largely dependent on the manufacturing technology selected. Generally, the following technologies are mainly used to produce the ball screw thread:

- Grinding (achieved accuracy class of the ball screw shaft thread pitch up to P1).
- Rolling (achieved accuracy class of the ball screw shaft thread pitch up to T5).

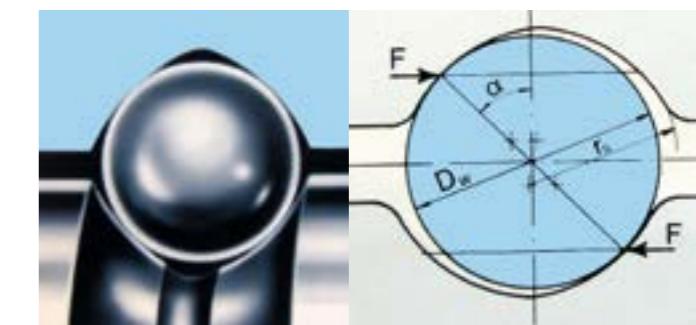

Ground thread

Rolled thread

## 2.3 Ball screw profile

To achieve the maximum transmission efficiency, it is necessary to make an ideal profile of the ball screw thread. The profile is not made of one radius but of two radii with offset (so called gothic arch, see the figure below). This profile shape offers an ideal efficiency to load capacity (ratings) ratio of the ball screw.

## 2.4 Ball screw preloading methods

Preloading method	Used on the ball nut units	Preloading method diagram
Preload using a spacer ring	AP+A, A+A, B+B+K	
Preload using differential nut thread pitch	APR	
Preload using the difference between individual threads (for multiple-start ball screws)	APV	

## 2.5 Materials used for manufacturing of the ball screws and their heat treatment

To manufacture the ball screw shafts, we use steel with the grade of **42CrMo4**. To manufacture the ball nuts, the most often used steel grade is **100CrMn6**.

Nuts and the threaded part of the shaft are hardened to **58-60 HRC**. The minimum strength of the core and non-hardened parts of the shafts is **Rm = 800 MPa**. The final quality is tested by long term durability tests followed

by the analysis of the functional parts of the transmission assembly when the specified wear limits are achieved. Based on the achieved information and knowledge of the operating conditions, it is possible to guarantee the actual product lifetime, or to propose an optimum product for the conditions given.

## 2.6 Load capacity (ratings), rigidity and recirculation system lifetime

Another main technical parameter for selection of the ball screw is its load capacity. There are two types of the ball screw load capacity:

**a) Static** load capacity ( $C_o$ ) is a static load, which corresponds to the permanent deformation of the ball and the running surface in the most stressed touch point; equal to 0.0001 of the ball diameter  $D_w$ .

**b) Dynamic** load capacity ( $C_a$ ) is a permanent, invariable load, which may be (in theory) transmitted by the ball screw with the basic lifetime parameter  $L_{10} = 1 \times 10^6$  revolutions.

The following equation is used to determine the **basic lifetime**, which is defined as number of shaft revolutions in relation to the nut body, performed with 90% reliability and with the force  $F$  applied, until the first signs of the material fatigue or functional recirculation elements are observed.

$$L_{10} = \left( \frac{C_a}{F} \right) \times 10^6 \text{ (rotation)}$$

**Rigidity** of the ball transmission ( $R$ ) is defined as a ratio of the external force applied ( $F_a$ ) and the nut axial shift  $\Delta$  on the ball screw shaft:  $R = F_a / \Delta$  (N/ $\mu$ m)

To achieve high rigidity and ensure axial play elimination, so called preload  $F_v$  is applied to the transmission chain, so that the ratio of the loading axial force  $F_a$ , which should not cause any play in the transmission yet, and **preload  $F_v$** , satisfies the following condition:  $F_a/F_v = 2,83$

To determine the force  $F_a$  and thus the preload value, it is necessary to consider this in a reasonable manner with respect to the time slope of the ball screw load, since the **preload reduces the transmission assembly lifetime**.

## 2.7 Ball screw mounting accuracy

The ball screws require accurate and stiff mounting. The ball screw and guiding surface axes must be parallel within 0.02 mm / 1,000 mm and the ball nut unit must ensure its perpendicularity with respect to the longitudinal axis within 0.01 mm / 100 mm. The ball nut units may be loaded only in the axial direction.

The long, narrow ball screws must be designed so that their movement assembly can compensate shaft deflections resulting from its weight (supports or the driven nut design modifications).

## 2.8 Ball nut mounting and removal procedure

If the nut needs to be removed from the delivered ball screw and then mounted back again, proceed as follows (please keep in mind that in the event of ball screw da-

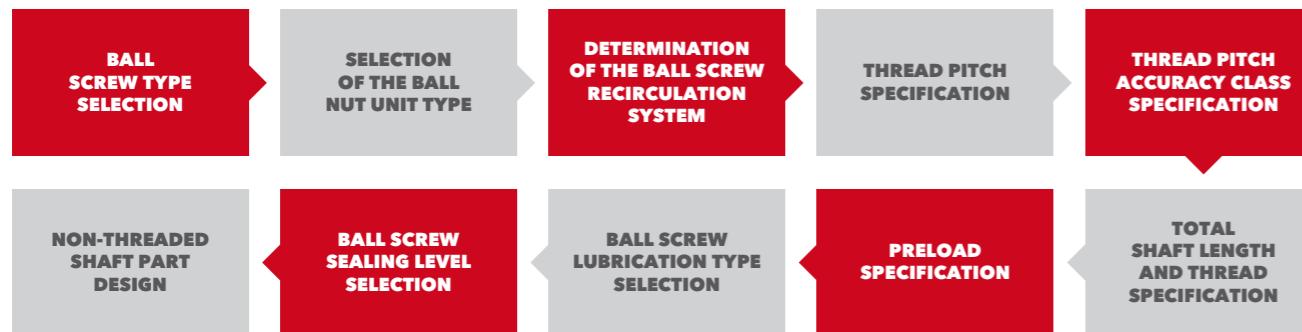

mage due to unprofessional installation or removal, the warranty on the damaged product becomes invalid):

Step #	Activity description	Procedure diagram
1	To avoid pouring the balls out when the nut is removed, it is necessary to push the assembly tube towards the shaft thread face. The tube diameter can be found in the tables for individual versions. Please contact our technical support in order to finding the tube diameter.	
2	Slowly rotate the ball nut to move it to the tube.	
3	Now the nut with the tube may be moved from the ball screw. Please keep in mind that if the assembly tube is pulled out from the ball nut, the balls will fall out of the nut unit.	

# BALL SCREW SELECTION GUIDE

A complete configurator of ball screws is freely available on our website. Partial steps of this configurator are shown below. The selection of the ball screw version from the offered production range is driven mainly by the functional

specification, required features and operating conditions. If you need any assistance with the design proposal, please contact our technical support, who will help you with the design proposal.

## 3.1 Ball screw type selection

At the beginning of the ball screw design it is necessary to select the ball screw type carefully. This selection should

be based on the requirements on the ball screw accuracy, motion quality, price, etc. There are four basic variants:

### Grounded screws for precise applications

- Ground thread
- Accuracy classes: P1, P3, P5
- Preloaded and non-preloaded nuts
- Length up to 15,500 mm
- Diameter up to 180 mm

### Power with no compromise

- Ground thread
- Accuracy classes: P3, P5
- Dynamic loads up to 4,000,000 N
- Diameter up to 200 mm

### When customised performance requirements are necessary

- Telescopic Ball Screws
- Threadless Ball Screws
- Ball Screws with Driven Nuts

### Basic quality for fair price

- Rolled thread
- Accuracy classes: T5 and T7
- Preloaded and non-preloaded nuts
- Length up to 5,600 mm
- Diameter up to 63 mm

## 3.2 Selection of the ball nut unit type

Description	Marking	Picture	Description	Marking	Picture
Non-preloaded nut without flange	A		Preloaded nut with flange	APR	
Non-preloaded nut with flange	AP		End cap return high-speed(fast-running) preloaded nut with flange	APV	
Double preloaded nut without flange	A+A		Non-preloaded nut with flange for shafts with rolled thread	APE	
Double preloaded nut with flange	AP+A		Driven nut with inserted bearings	RMV	

## 3.3 Determination of the ball screw recirculation system

**Nominal thread diameter  $d_0$**  is selected in the tables (chapter 4) based on the dimensions available and the required application. Nominal thread diameter determines the ball screw shaft column strength depending on

Recirculation system name	Maximum speed coefficient	Version marking	Recirculation unit design	Recirculation system function	Recirculation system information
External ball recirculation - axially inserted	$n_{\max} = \frac{125\,000}{d_0}$	EX - A			Housing dimensions in accordance with ISO 3408, a higher load capacity with the same nut length compared to the internal return system.
External ball recirculation - radially inserted	$n_{\max} = \frac{125\,000}{d_0}$	EX - R			Housing dimensions in accordance with ISO 3408, a higher load capacity with the same nut length compared to the internal return system.
External ball recirculation - endcap	$n_{\max} = \frac{125\,000}{d_0}$	EX - E			Housing dimensions bigger than in accordance with ISO 3408, a return system suitable for high pitches and multiple-start ball screws.
Internal ball recirculation	$n_{\max} = \frac{100\,000}{d_0}$	IN			Housing dimensions smaller than in accordance with ISO 3408, a lower load capacity with the same nut length compared to the return systems with radially or axially inserted segments.

### 3.4 Thread pitch specification

**Thread pitch P** determines the nut travel per one rotation of the ball screw shaft. The standard offered combinations of the thread diameter and pitch can be found in the tables (see the chapter 4).

### 3.5 Thread pitch accuracy class specification

**Thread accuracy class** - the ball screws are offered in several **accuracy classes**, which are described in more detail in the **ISO 3408 standard**. The highest accuracy class are often used in cases where very precise positioning is required (e.g. machine tools). Lower accuracy classes are often used for applications where the positioning precision requirements are not high (e.g. manipulators). The accuracy classes can be found in the table below:

Pitch tolerance on the thread length of 300 mm (mm)	Ground thread		Rolled thread		
	P1	P3	P5	T5	T7
0.006	0.012	0.023	0.023	0.052	

### 3.6 Shaft and thread lengths

The **total shaft and thread lengths** are among the most important parameters of the complete ball screw. The shaft lengths offered are technologically limited and

they are directly related to the thread accuracy and other parameters selected. The length limitations are described in the table below.

		Nominal screw diameter (mm)														
Recommended length of the thread (mm)	Class Accuracy	16	20	25	32	40	50	63	80	100	125	140	160	200		
Ground thread	P1	500	1200	1800	2000	4000	4500	5000	5000	5000	5000	4850	4850	3000		
	P3	600	1500	3000	3500	4500	5000	8250	8250	8250	8250	6000	6000	3000		
	P5	700	1800	3600	4000	5000	7500	12000	13000	15000	15500	6000	6000	3000		
Rolled thread	T5	5600	5600	5600	5600	5600	5600	5600	5600	-						
	T7	5600	5600	5600	5600	5600	5600	5600	5600	-						

If the table above does not include the required design, we may not be able to provide this design. In this case, please contact our technical support, who will be pleased to assist you.

### 3.7 Preload specification

Based on the positioning precision and rigidity required, the proper ball nut mating on the shaft method should be selected. The higher the preload, the shorter ball screw transmission lifetime. The following options are available as standard:

- Fitted nut with axial play
- Fitted nut with preload corresponding to 3% of the dynamic load ratings (suitable for precise positioning and less loaded screws)

### 3.8 Ball screw lubrication type selection

The ball screws are lubricated by oil or grease. The lubrication method and the lubricants used are the same as for rolling bearings. The basic amount of lubricant for the specific ball nut unit is specified and recommended on request.

#### Oil lubrication

In general, the ball screws are lubricated with the same oils as the rolling bearings, i.e. with transmission or bearing mineral oils with the minimum viscosity of **50 mm<sup>2</sup>/s** at the temperature of **40 °C**. The oil amount is dependent on the operating conditions.

#### Grease lubrication

If the ball screw is lubricated by grease, the **class 2 acc. to DIN 51825** is recommended. The following standard greases can be used:

- KLÜBER Isoflex NBU 15
- OPTIMOL OPTITEMP TT1

During the normal machine operation, the grease should be added every 6 to 10 months. Never mix the greases with different properties during the machine operation.

### 3.9 Ball screw sealing level selection

The sealing level is dependent on the working environment of the ball screw. There are 3 standard sealing types available:

Polyamide wiper ring

Polyamide wiper ring with felt ring

Polyamide wiper ring with felt ring and brush

### 3.10 Non-threaded shaft part design

The standard shaft ends are shown in the „Standard ball screw ends“ catalogue. Other design proposals of the non-threaded ends based on the customer's require-

ments are possible. If you are interested in help with the design proposal, our technical support department will be pleased to assist you.

# BALL SCREW DESIGN

## 4.1 Precise screw

This type of ball screws is mostly used for the practical purposes due to its versatility, excellent technical parameters

and wide range of variants. Usually they are screws with ground threads.

### Basic technical parameters:

- Diameter from 12 to 180 mm
- Length up to 15.5 m
- Accuracy classes P1 to P5
- Minimum strength of the shaft material is  $R_m = 800 \text{ MPa}$
- Efficiency approx. 94-97 %
- Operating temperature  $-40^\circ\text{C}$  to  $+80^\circ\text{C}$  (acc. to the lubricant type)

### Application:

- Grinding machine tools
- Milling and boring machine tools
- Machining centres
- Precision lathes
- Others

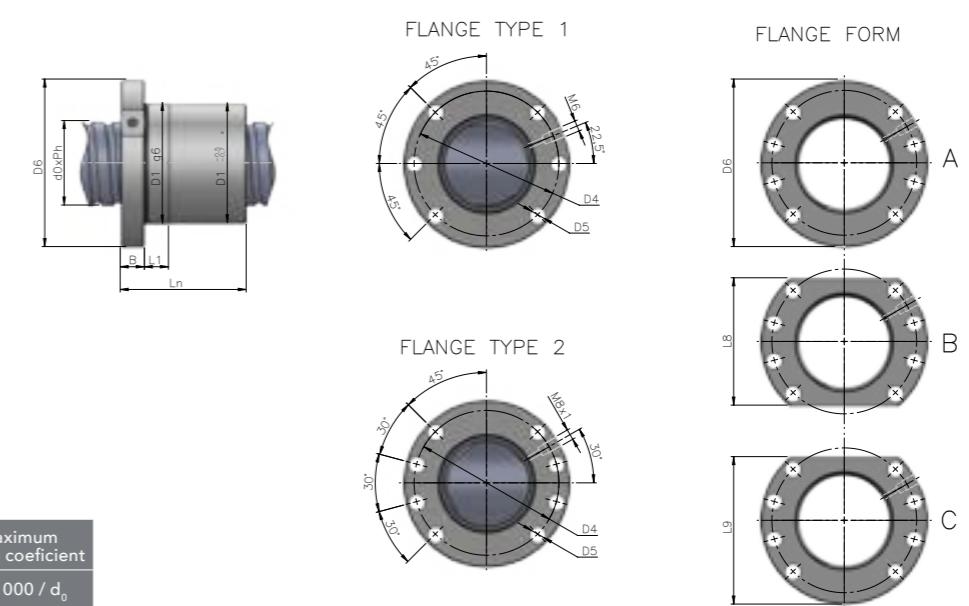

### Category characteristics:

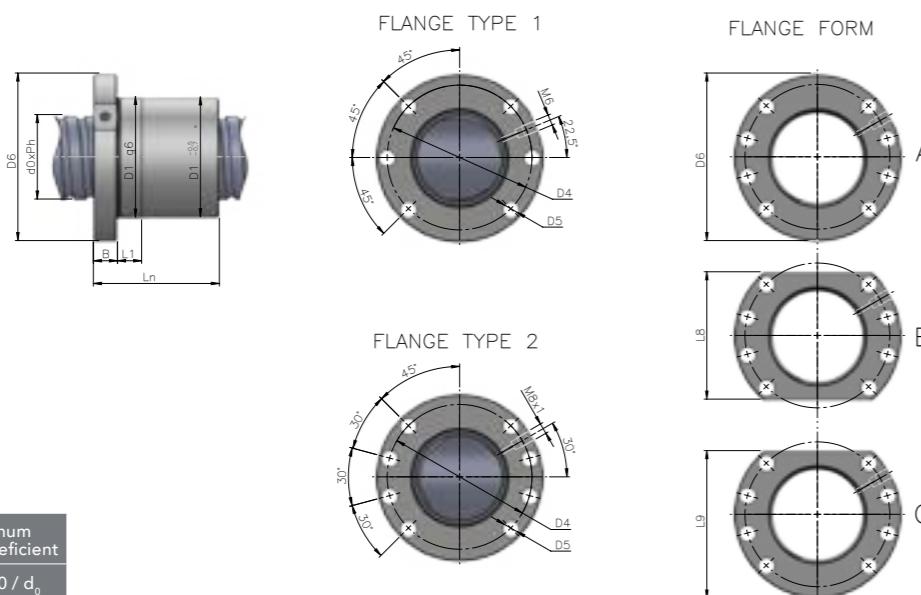

- Precise positioning screws
- Wide choice of sizes and pitches
- Delivered with the required preload adjusted

## 4.2 Basic screw

Transport ball screws are used for applications with less emphasis on the high precision of positioning, e.g. trans-

port or lifting equipment, woodworking machines, etc. The screw thread is rolled.

### Basic technical parameters:

- Diameter up to 63 mm
- Accuracy classes T5, T7
- Minimum strength of the shaft material  $Rm = 650 \text{ MPa}$
- Efficiency approx. 93–95 %
- Operating temperature  $-20^\circ\text{C}$  to  $+60^\circ\text{C}$  (acc. to the lubricant type)

### Category characteristics:

- Very good quality/price ratio
- Standard geometrical and working accuracy, lifetime and load ratings in accordance with ISO 3408

### Application:

- Transport mechanisms
- Woodworking machines tools
- Industrial automation
- Others

### 4.3 Heavy duty screw

Heavy duty ball screws provide more than double load capacity and rigidity compared to the standard ball screws due to a modified radius of the thread profile.

The high-load ball screws have lower efficiency and are designed for slow-running applications only. The high-load ball screws are usually produced as non-preloaded.

#### Basic technical parameters:

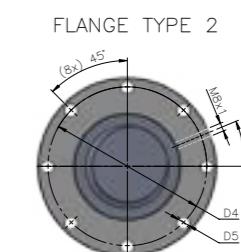

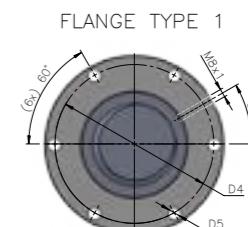

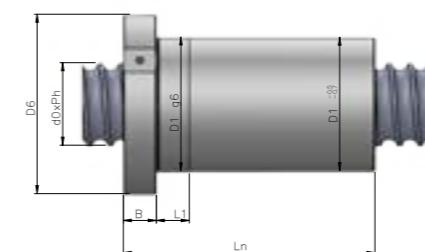

- The recommended thread diameter range from 40 to 200 mm
- Minimum strength of the shaft material is  $R_m = 900 \text{ MPa}$
- Efficiency approx. 93–95 %
- These ball screws should be lubricated by lubricants for high loads
- Dynamic loads up to 4,000,000 N

#### Category characteristics:

- Ball screws for high axial loads

#### Application

- Injection molding machines
- Electric presses
- Lifting equipment
- Replacements of hydraulic cylinders
- Others

## 4.4 Special screw

The special ball screw category includes e.g. these variants:

### Telescopic ball screw:

- Used in applications where small housing dimensions and large pitches are required (e.g. handling platforms, hexapods, etc.).
- It is a telescopic set of several ball screws screwed in one assembly. The ball nuts work as bearings supporting the inner ball screw assembly.
- The telescopic ball screws replace hydraulic cylinders with the advantage of easy control and positioning.

*Telescopic ball screw*

### Linear actuator:

- The linear actuator ensures motor controlled linear movement within the operating range; it replaces the hydraulic cylinders. It uses the transmission of the rotary to linear motion using the ball screw with minimum efficiency of 95 %.
- The movement speed can be controlled or adjusted by a suitable selection of the used.

*Linear actuator*

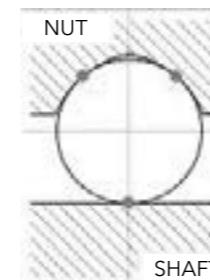

### Threadless ball screw:

- The threadless ball screw is intended especially for motion mechanisms of manipulators and transport equipment, which require efficient transmission of the rotary to linear motion without emphasis on the rigidity and load capacity, but with requirements on simplicity, easy maintenance, and undemanding manufacturability.

*Threadless ball screw*

- The profiled thread is used only for the ball nut and the forces are transmitted via the balls inserted between this profile and the smooth cylindrical profile of the shaft. To transmit the forces, this solution uses elastic deformation of the hardened and ground cylindrical shaft, on which the preloaded balls in the profiled inner thread of the nut are rolling.

*Threadless ball screw operation*

If you are interested in any of the above mentioned designs, we will be pleased to provide you with our technical support.

KSK is a sought-after partner for precision machine tool manufacturers worldwide. You will get this position thanks to its reliability, excellent quality and smart selection.

- The up-to-date catalogue version is always available on the company website in section Downloads.
- General terms and conditions as well as operating conditions can be found on the company website in section Downloads.
- Most of the used calculations are based on the ISO 3408 standard dealing with ball screws.
- Due to continuous technical development within our company, the technical parameters quoted in this catalogue are not binding on the KSK Precise Motion, a.s. company.
- The KSK Precise Motion, a.s. company hereby declares that it bears no liability for incorrect design proposals made by customers based on the data contained in this catalogue. If you need assistance, please contact our technical support.
